

Modelling: Sci-fi Silo

Taylor Raine - 25156239

Intro

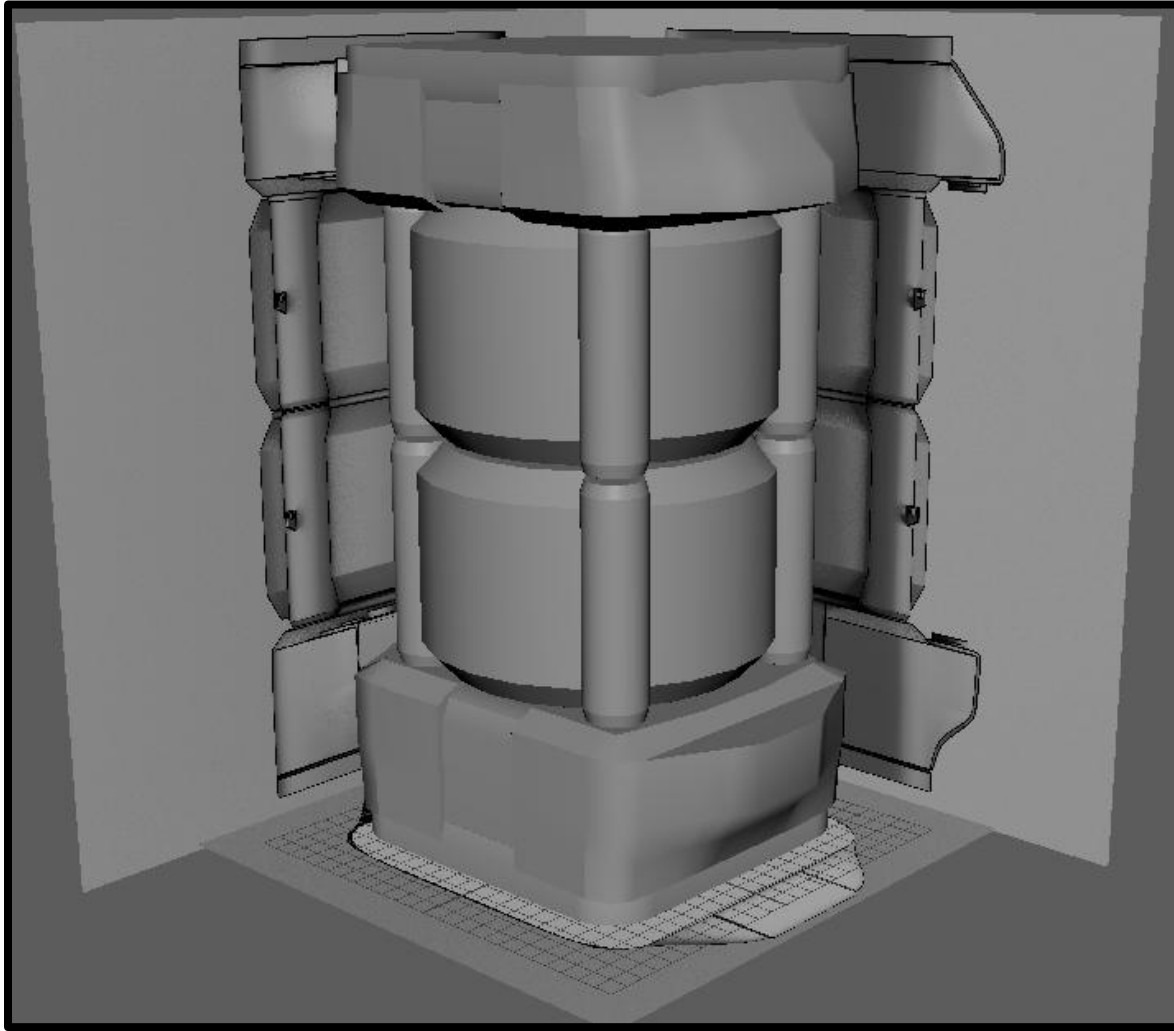

My names taylor raine and For this assignment, I was given the goal of recreating this Sci-Fi style storage silo.

Originally design by splash damage.

Mood board

Block out

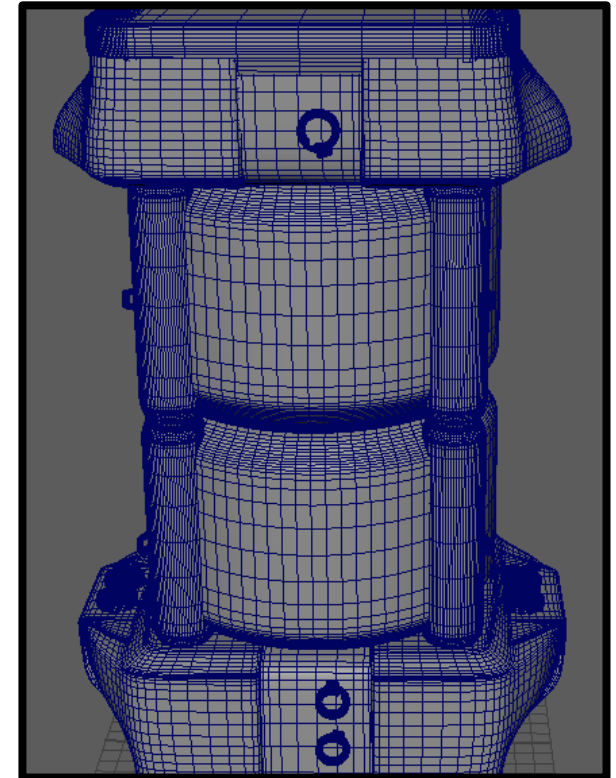

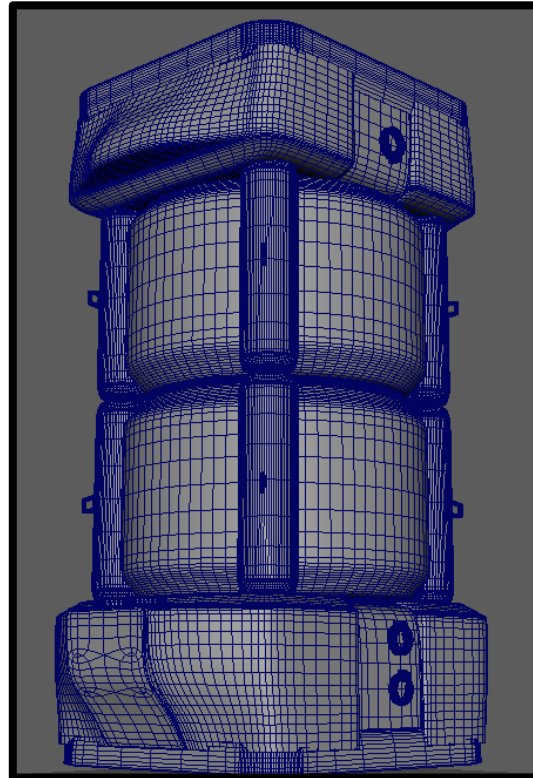

To start I created a simple block out to correctly set the scale and position of each part

High Poly

Using the Block out as a base I designed the high poly version of my silo.

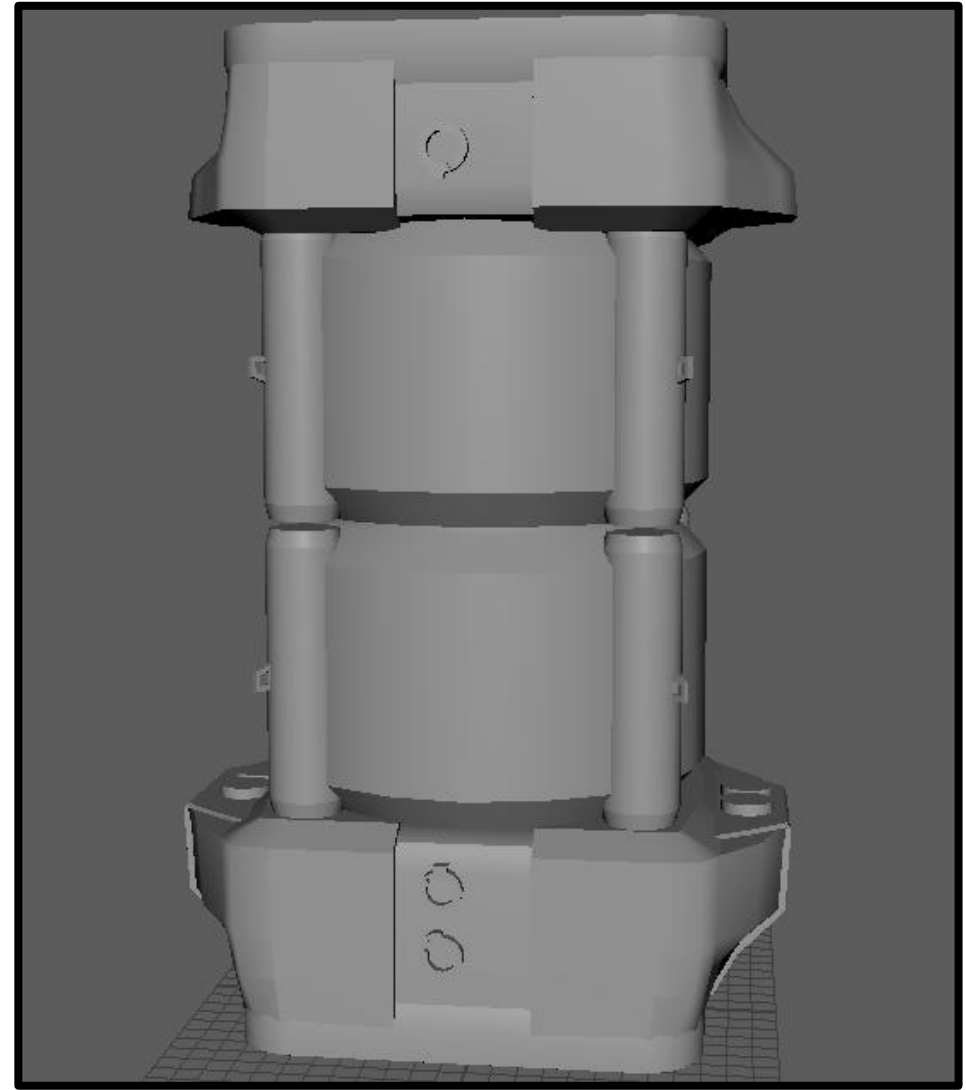

matching the curvature and small details to that of the reference

Low Poly

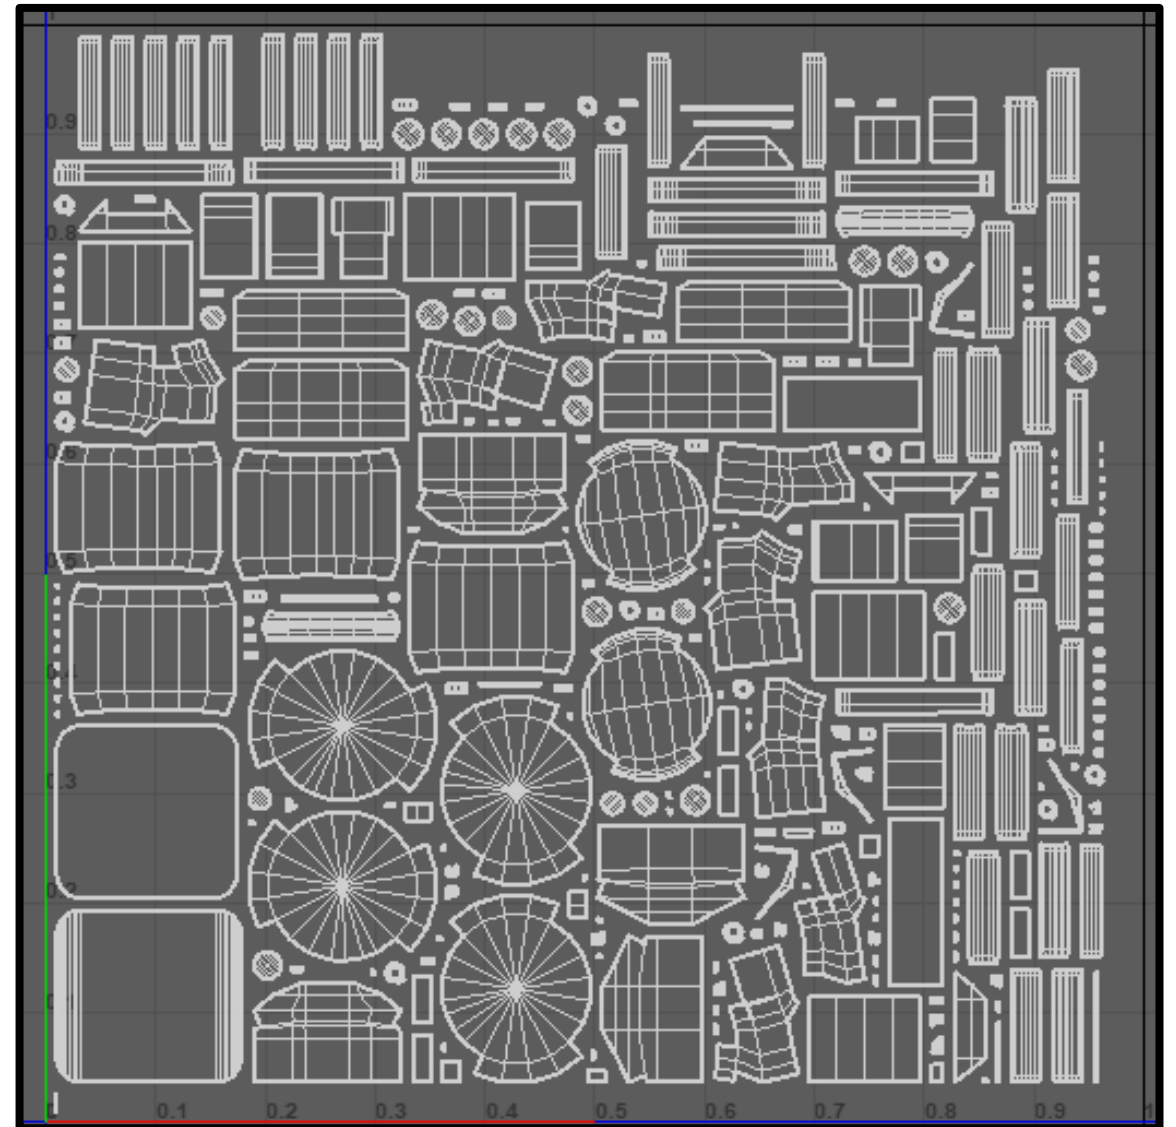

From my high poly, I made the low poly by removing all the unnecessary edges and vertices, being careful to remove all N-gons while keeping the silhouette intact.

I also assigned ID materials to each part of the Model.

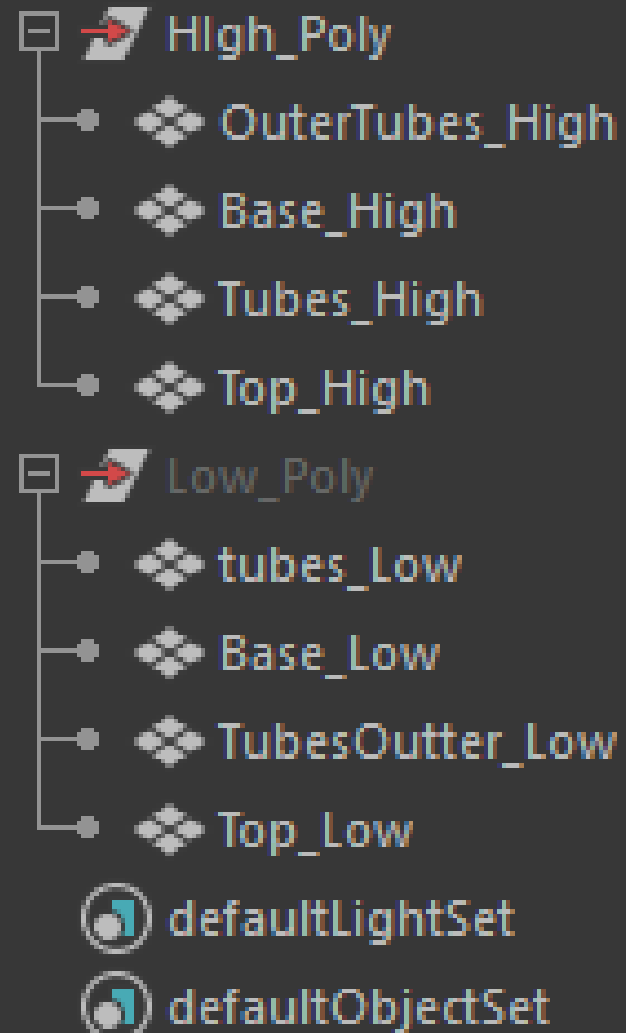

UV's

Then using mays auto UV tools,
I made a simple UV map of my
model

Naming Scheme

Before carrying on I made sure that both my high and low poly followed a naming scheme, with both having a relative describer at the end. E.G _Low

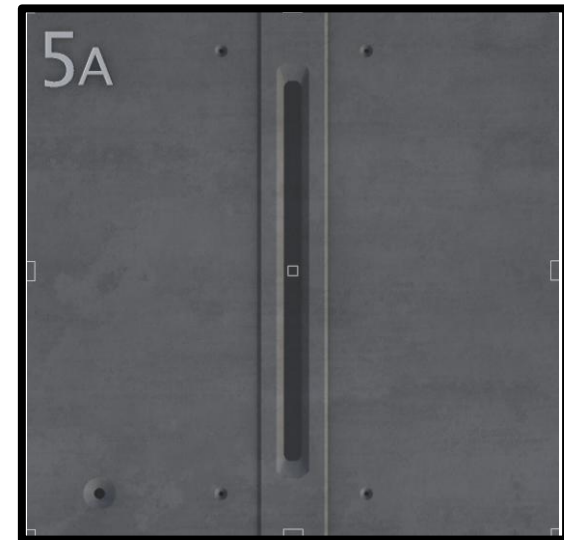

Baking the Model

I then used substance painter to bake the high polys details onto the low poly model

Trim Sheets

For the Textures of my Silo, I decide to try out some trim sheets for the parts with more unique details.

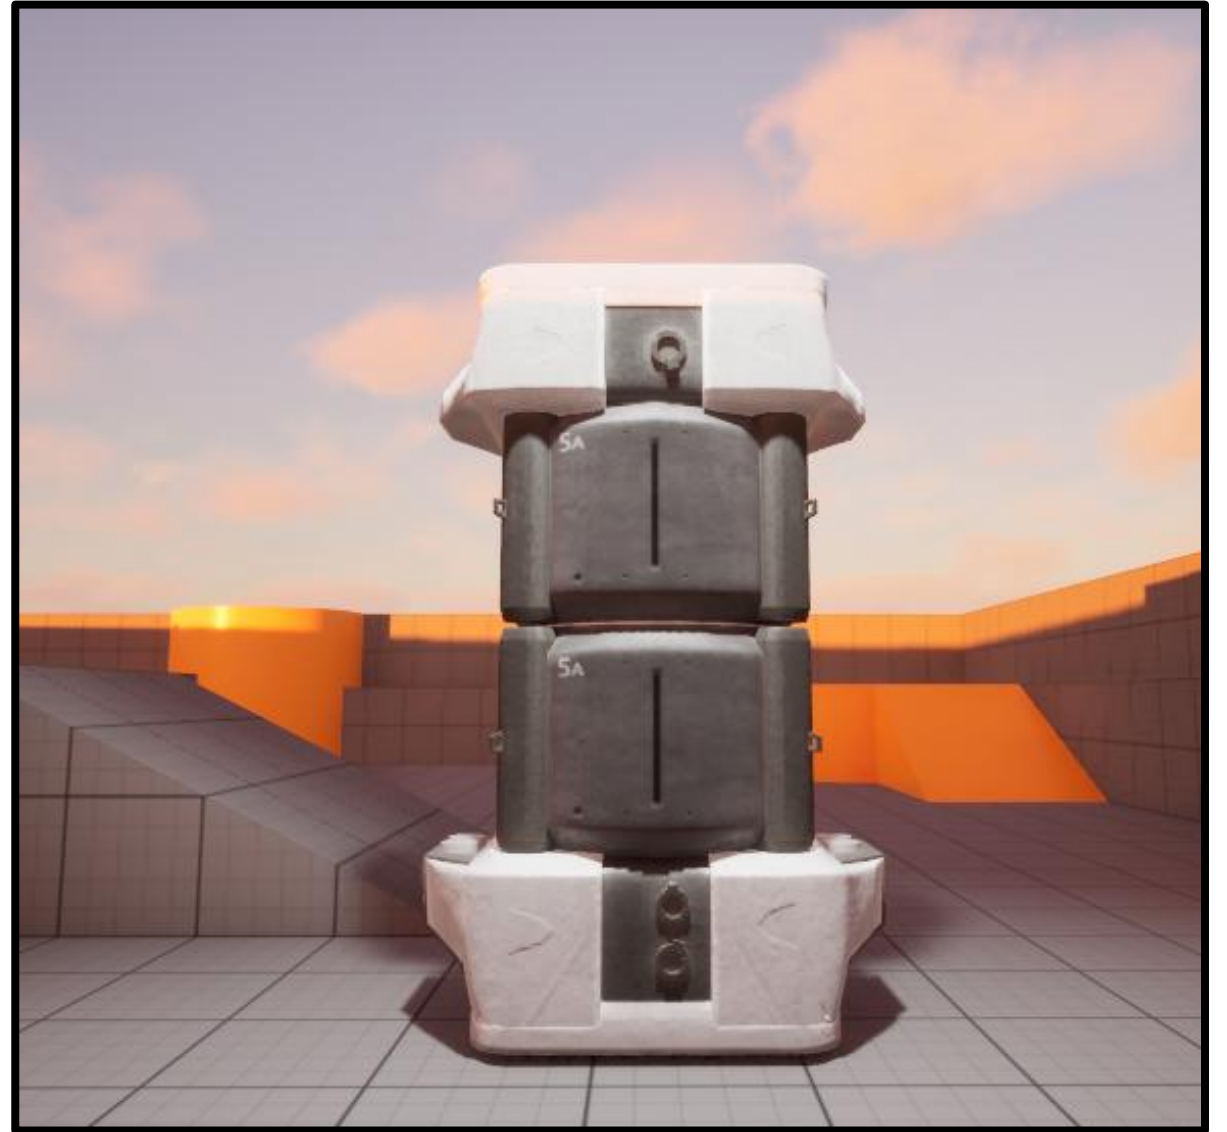

Texturing

Continuing in substance painter I used the trim sheets I had just made to apply the textures

Unreal Render

With the silo now texture I imported it into Unreal engine and created a high-Resolution screen shot

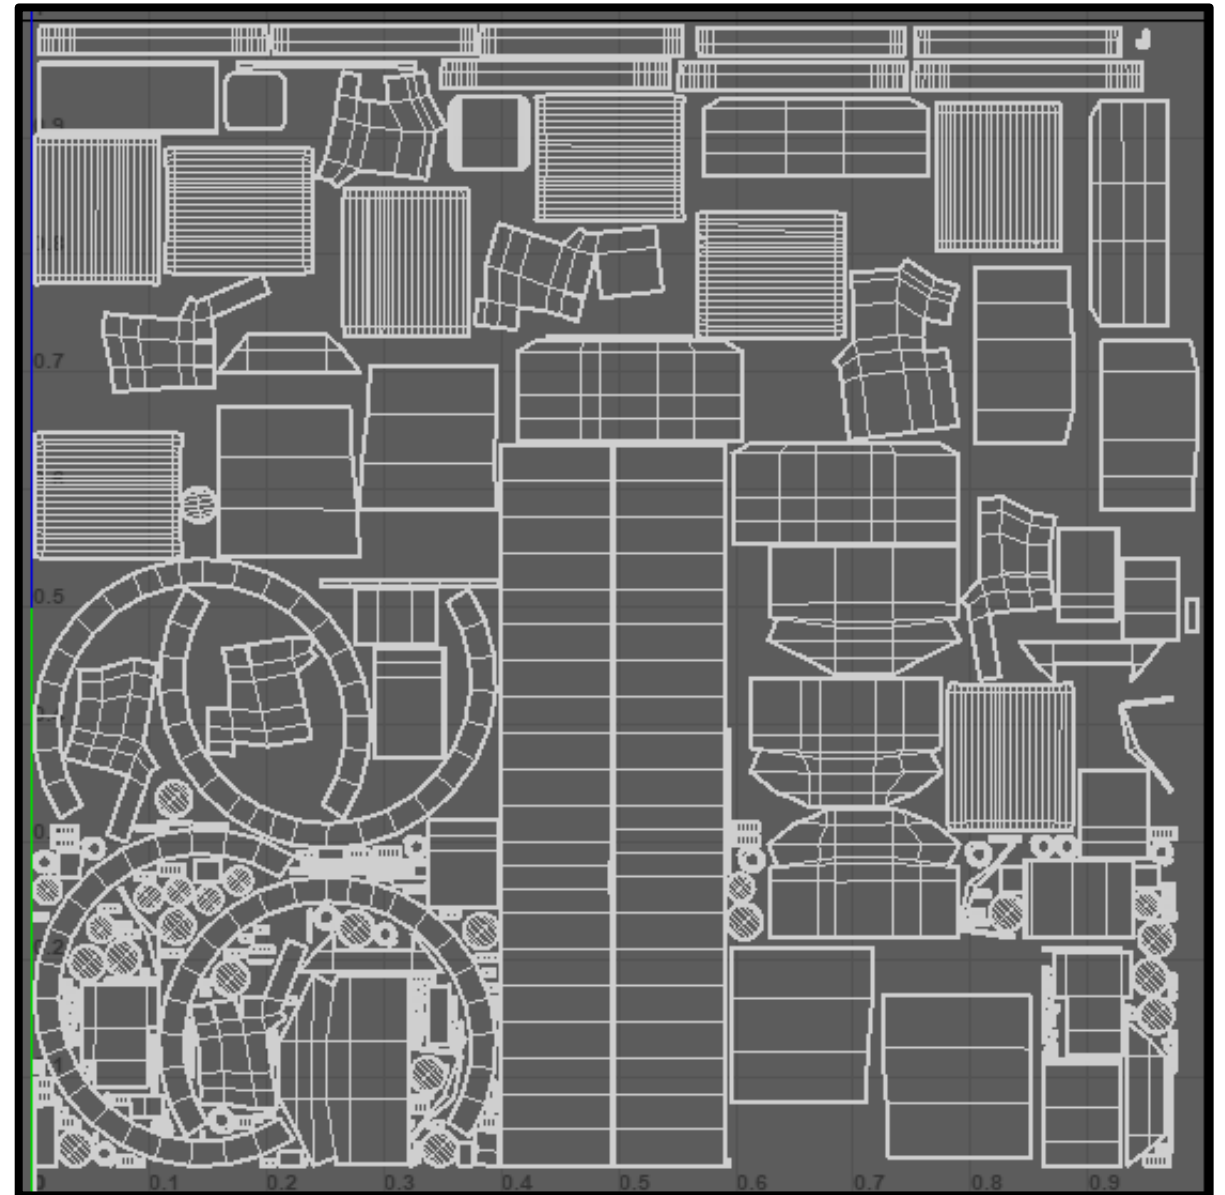

Redesign

Looking at my final version, I realised I wasn't very pleased with the final look, so I decided to redo most of the texturing process to make an improved final look.

Starting with a new UV layout.

Corrected UV's

Returning to Maya I looked at each part of the asset, sewing and cutting edges to make a better layout

Re Texture

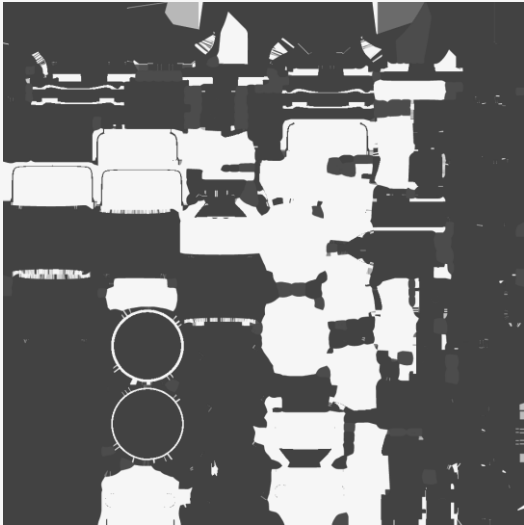

With these new UV's I quickly re-baked the model.

I also decided to use substance painters painting features with a black mask to add the high maps and more precise colours.

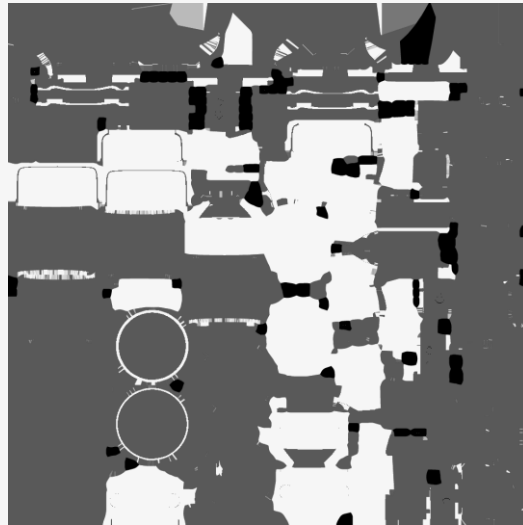

I also changed the material to be more metallic
